About the DVT

### Introduction

Design Verification Test system, or DVT, is the main interface program used to interface with the Sevcon motor controller. Over the course of this manual, you will be instructed on how to effectively use the DVT and the user interface known as the helper.

Chapter 1: DVT Main Page

#### **Starting out**

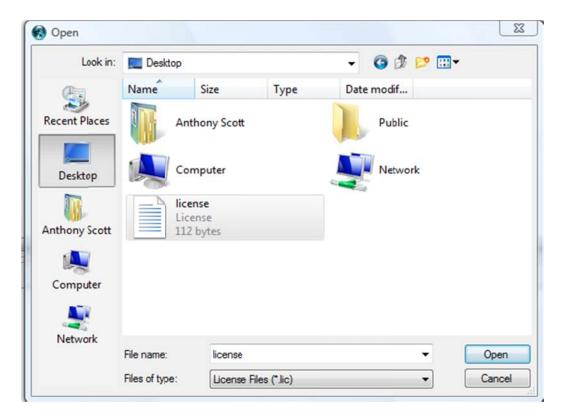

Upon first installing DVT, the user will receive a prompt asking the user to accept the terms and conditions of use, as well as a license file. This license file is used to ensure the copy of DVT is genuine.

DVT Program Activati	on	
A valid license is re	quired to run this program. To obtain a license, please email the activation cod license.support@sevcon.com	le below to:
DVT is designed for performance monito	connection to Sevcon motor controllers/inverters and is used for their configura ing.	ation and
OVT must only be u nverters.	sed by competent personnel, trained in the safe operation of Sevcon motor con	ntrollers/
the second s	ectly, or unsuitable configuration, could result in an unsafe system. vised to immediately contact Sevcon for support and/or additional training.	
agree to:		
<ol> <li>Hold Sevcor</li> <li>Comply with such as a m</li> <li>Use controll</li> <li>Retain full re</li> </ol>	all software licensing terms. harmless from any claims resulting from the use of this software. all usage guidelines and advisory notification provided by Sevcon or relevant p otor manufacturer. ers/inverters only in accordance with their product release level, as advised by esponsibility for ensuring overall system safety.	
Accept		
ctivation Code:	YjUwMGY1MTQtYTg5My00NzY3LWIzOTMtOGUxZWE5MmIzYzQ	Сору
icense File Path:		Browse
icelise rile raul.		

To accept the terms and conditions, the user will have to select the check box that says "Accept"

After emailing the address shown above, the user will receive a license via email as soon as possible.

Loading the License into DVT is as follows, first by selecting the "browse" button to open the local computer's file directory. The file can be found wherever the user saves it.

After selecting the file, its pathway will show in the activation window:

License Activation		-	(prost			
DVT Program Activatio	on

					Activate	Cancel

Select the "Activate" button and restart DVT. DVT will then be ready for use.

This is the main page of DVT. From here all of the functions and settings of the Sevcon motor controller can be accessed:

### **Baud Rate**

The baud rate is the Button on the main screen is used to set the DVT to communicate at the configured Sevcon controller baud rate.

The different baud options can be seen inside the red box. There is currently an incorrect baud of 100 kHz rate selected. This is visible because the CAN window (seen in the blue box) is empty, and the software is unresponsive. If an incorrect baud rate is selected then the CAN window remains blank.

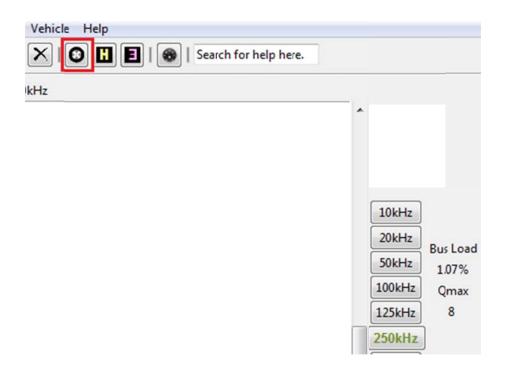

🗃 🗙   🚴 📴   🗙   💽 🧭   🗶 🚰 🛃   🗶   🕄 🖪   🚳   Search for help he

If correct baud is selected then CANBus transmissions will be seen scrolling in the CAN window. The DVT is now ready to perform operations

### **Vehicle interface**

The DVT comes with a feature that will allow the user to view a variety of information on the motor, such as the current voltage and the temperature, in real time. This is the vehicle interface and it can be accessed by selecting the "O" button found here:

Selecting the button will open a window separate to the DVT that looks like this:

	Current Control Performance		
Vatch			
	1, Mtr1 Id_ref (0.0625)	-2147483647.0	
	1, Mtr1 Iq_ref (0.0625)	-2147483647.0	
	1, Ibat (0.0625)	-2147483647.0	
	1, Mtr1 I(RMS) (1.0000)	-2147483647.0	
	1, Mtr1 Ud (0.0625)	-2147483647.0	
	1, Mtr1 Uq (0.0625)	-2147483647.0	
	1, Mtr1 Mod Index (0.3922)	-2147483647.0	
	1, Ls (0.0596)	-2147483647.0	
	1, Iv_lim (1.0000)	-2147483647.0	
	1, max flux (1.0000)	-2147483647.0	
	1, Iq max (1.0000)	-2147483647.0	
	1, Mtr1 Temp PTC 1 (1.0000)	-2147483647.0	
	1, Vcap (0.0625)	-2147483647.0	
	1, Heatsink (1.0000)	-2147483647.0	
	1, L Trac Tmax/tgt (1.0000)	-2147483647.0	
	1, L Trac w_ref/max (1.0000)	-2147483647.0	
	1, Mtr1 w (1.0000)	-2147483647.0	

This window will update in real-time with settings and information about the motor controller setup. Information displayed depends on the TPDO setup of the motor controller.

## **Information Window**

The window found in the center of the DVT homepage is known as the "Information Window". This window can give a variety of information to the user such as current faults inside the controller, DLD download progress and EDS file creation progress.

For example, here the window shows a "low battery" fault in the controller:

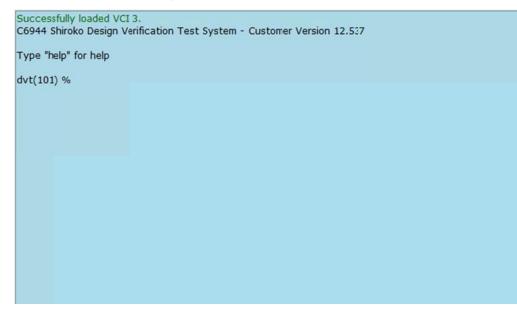

```
Information Node 1 fault (0x45C3, Low battery) set at 10:51:44, 15/01/13. Data (0x01 0x01 0x00). CANopen Error Code: 0x3100
```

After clearing the fault, the DVT will report to the user that the fault has been cleared by showing the error message in green.

```
Node 1 fault (0x45C3, Low battery) set at 10:51:44, 15/01/13. Data (0x01 0x01 0x00). CANopen Error Code: 0x3100
Node 1 fault (0x45C3, Low battery) cleared at 10:53:10, 15/01/13. Data (0x43 0x50 0x16). CANopen Error Code: 0x0000
```

## **Input Window**

The DVT comes with a low-level input window for giving commands manually to the Sevcon motor controller, and is found here:

This tool is recommended for more experienced users of DVT only, for more information please contact Sevcon.

Information

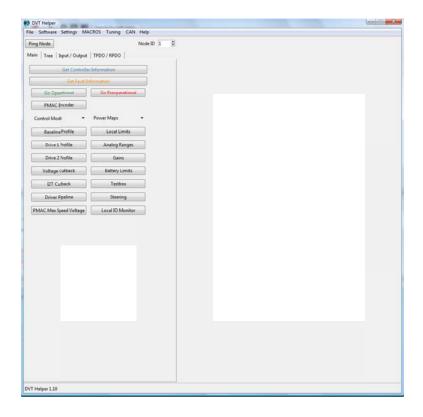

## **Accessing the Helper**

The helper is the main user interface found in the DVT. Its function is to make viewing/changing settings inside the controller easier, creating TPDO/RPDO's and managing Input/output connections with a user friendly interface. The helper can be

accessed through selecting the *I* found here:

This is the helper, and all of its features will be detailed in the following chapter.

### **Accessing Different Nodes**

If there is more than a single node connected to the network, DVT can be used to access each node via the helper. This is done through the node ID switch found here:

Ping Node	Node ID 1 🔹
Main Tree Input / Output	It TPDO/RPDO
Get Contro	ller Information
Get Fault	Information
Go Operational	Go Preoperational
PMAC Encoder	
Control Mode	Power Maps 👻
Baseline Profile	Local Limits
Drive 1 Profile	Analog Ranges
Drive 2 Profile	Gains
Voltage Cuthack	Ratten/Limits

By clicking the small arrows seen above, I can cycle through different node ID numbers. There is no alert system or notification. As soon as the number changes; helper commands will be sent to that node.

Chapter 2: Main Helper Functions

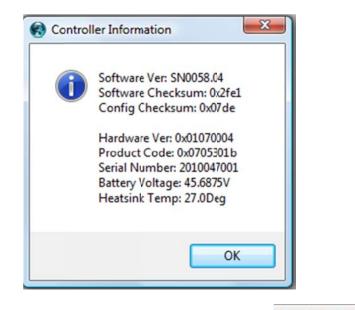

## **Getting Controller Information**

Basic hardware and software information about the Sevcon controller can be found by selecting the "Get Controller Information" button. The first button found on the main page of the helper.

Main	Tree Input / Outp	ut TPDO/RPDO
	Get Controll	er Information
	Get Fault I	Information
	Go Operational	Go Preoperational

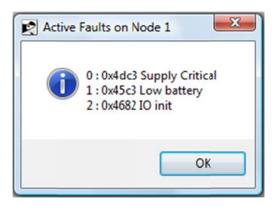

Selecting this button will cause a new window to open, which will fill with information on the controller:

This information can be refreshed at any time by selecting the <u>Get Controller Information</u> button again.

Gen4 is designed to detect a range of operational faults. Selecting the

Get Fault Information button will open a window which displays the Fault ID code and simply description of any active faults at that time.

# **Operational and Pre-Operational**

Two of the most important buttons on the Helper are the "<u>Go Operational</u>", and "

**Go Preoperational**" buttons. These buttons are used to activate critical functions within the gen4.

## **Go Operational**

Selecting the "Go-Operational" button will essentially set the controller to "ready to drive". While in this mode, the many of the motor controllers' settings cannot be changed.

# **Go Preoperational**

Many of the controllers' objects can only be changed while in pre-operational mode. When in pre-operational mode, CAN PDO messages will not be transmitted from the controller.

### **Baseline Profile**

Once the helper is open, access to the majority of the variables within the DVT's object database is granted. Take for example: the maximum forward and reverse rpm in the motor. These are two settings that can both be changed very easily

First, select the button labeled "Baseline Profile". Doing so will bring up this menu full of objects on the right side of the helper:

Go Operational		Go Preoperational	
PMAC Encoder			
Control Mode	Ŧ	Power Maps	-
Baseline Profile		Local Limits	
Drive 1 Profile			

Doing so will bring up this menu full of objects on the right side of the helper:

Tracti	on baseline p	orofile	
Maximum Torque applied during drive	100.0	%	<u>^</u>
Maximum Torque applied during a direction change	5.0	%	
Maximum Torque appled when neutral braking	5.0	%	
Maximum Torque applied when footbraking	0.0	%	
Maximum Speed in forward direction	510.0	rpm	
Maximum Speed in reverse direction	200.0	rpm	E
Ramp up rate during drive	3000.0	%/s	1
Ramp up rate during direction change braking	1000.0	%/s	
Ramp up rate during neutral braking	1000.0	%/s	
Ramp up rate during footbraking	1000.0	%/s	
Ramp down rate during drive	400.0	%/s	
Ramp down rate during direction change braking	1000.0	%/s	
Ramp down rate during neutral braking	200.0	%/s	
Ramo down rate during footbraking	1000.0	%/s	Ŧ
Read Values			Load Values

The setting highlighted above is going to be changed (in this case, the maximum forward rpm) to 600 and the reverse to 450. To do this, first click inside of the appropriate text box, and delete the contents.

Maximum Speed in forward direction	rpm
Maximum Speed in reverse direction	rpm

Then, enter the desired figures into the boxes like so:

Maximum Speed in forward direction	600	rpm
Maximum Speed in reverse direction	450	rpm

Finally select the Load Values button found in the bottom right of the window to finalize the values.

## **Local Limits**

ſ

DVT Gives the user control over the limits in both current and torque of a motor through use of the controller. The easiest way to access these functions the local limits "

Local Limits ," bu	utton found here:
Main Tree Input / Output	TPDO / RPDO
Get Controlle	r Information
Get Fault In	nformation
Go Operational	Go Preoperational
PMAC Encoder	
Control Mode 👻	Power Maps 👻
Baseline Profile	Local Limits
Drive 1 Profile	Analog Ranges

Selecting this button will open up the local limit menu.

		Local Limits	
Maximum torque	100.0	% of peak	
Torque slope	2000.0	% rated/s	
Current limit	275.0	A(RMS)	
Peak torque	70.0	Nm	
Maximum motor speed	10000.0	RPM	
Maximum acceleration rate	10000.0	rpm/s	
Read Values			Load Values

From this menu, the user can access the torque and current settings of the motor attached to the system. To change the current limit (the minimum voltage that can be set without the line contactor opening) from 275A to 280A, the process is as follows:

		Local Limits
Maximum torque	100.0	% of peak
Torque slope	2000.0	% rated/s
Current limit	275.0	A(RMS)
Peak torque	70.0	Nm
Maximum motor speed	10000.0	RPM
Maximum acceleration rate	10000.0	rpm/s

First, clear the text box of the current limit.

Current limit A(RMS)

And now enter the desired under voltage limit (in this case, 280A)

Current limit 280 A(RMS)

To confirm the change, select the **Load Values** button in the bottom right of the window.

## **Driveability Profiles**

DVT can be used to set alternate Drive Profiles in the Sevcon controller. Through the " Drive 1 Profile," and "Drive 2 Profile," buttons.

Driveability profiles allow vehicle operation under different speed, torque, acceleration and deceleration. The buttons to access them are shown below:

Baseline Profile	Local Limits
Drive 1 Profile	
Drive 2 Profile	Gains
Voltage Cutback	Battery Limits

Selecting either of these buttons will open the appropriate profile window. The available parameters in DP1 and 2 are identical to the menu from "Baseline Profile" and can be edited in the same way.

Drivea	bility Select 1	Profile	
Maximum Torque applied during drive	6553.5	%	_
Maximum Torque applied during a direction change	6553.5	%	
Maximum Torque applied when neutral braking	6553.5	%	
Maximum Torque applied when footbraking	6553.5	%	
Maximum Speed in forward direction	65535.0	rpm	
Maximum Speed in reverse direction	65535.0	rpm	-
Ramp up rate during drive	6553.5	%/s	E
Ramp up rate during direction change braking	6553.5	%/s	
Ramp up rate during neutral braking	6553.5	%/s	
Ramp up rate during footbraking	6553.5	%/s	
Ramp down rate during drive	6553.5	%/s	
Ramp down rate during direction change braking	6553.5	%/s	
Ramp down rate during neutral braking	6553.5	%/s	
Ramo down rate during footbraking	6553.5	%/s	-
Read Values			Load Values

# **V/F Ratio**

DVT can be used to control the voltage/frequency of the motor control through the "

V/F Ratio " button found here:

Get Controll	er Information
Get Fault I	Information
Go Operational	Go Preoperationa
V/F Ratio	Id Factor Table

Selecting this button will open up the v/f window in front of the helper:

🚯 dvt_vf	
Lm - Im Esti	mates
Rated Phase Current:	
Rated Line Voltage:	
Rated Frequency (Hz):	
Power Factor:	
	ulations
V/F Ratio Calo	
Im Rated (A)	25.000
Im Rated (A)	25.000
Im Rated (A) Mag Inductance (uH)	25.000 40847.778
Im Rated (A) Mag Inductance (uH) Ud Stabilization Factor	25.000 40847.778 0.000
Im Rated (A) Mag Inductance (uH) Ud Stabilization Factor Iq Min	25.000 40847.778 0.000 0.000
Im Rated (A) Mag Inductance (uH) Ud Stabilization Factor Iq Min VF Gain	25.000 40847.778 0.000 0.000 0.000
Im Rated (A) Mag Inductance (uH) Ud Stabilization Factor Iq Min VF Gain Pole Pairs	25.000 40847.778 0.000 0.000 0.000 4.000 48.000

## **Analogue Ranges**

DVT allows the user to adjust the minimum and maximum allowed voltages on all of the analog inputs attached with the motor controller. These functions can be accessed

Baseline Profile	Local Limits
Drive 1 Profile	Analog Ranges
Drive 2 Profile	Gains

Selecting this button will open a menu on the right side of the helper:

	Analog Ranges	
Minimum allowed voltage 0.0	v	
Analog input 1 voltage 5.84	765625 V	
Maximum allowed voltage 255.99609375	v	
Minimum allowed voltage 0.0	V	
Analog input 2 voltage 0.1	484375 V	
Maximum allowed voltage 255.99609375	v	
Minimum allowed voltage 0.0	v	
Analog input 3 voltage 11.3	203125 V	
Maximum allowed voltage 255.99609375	v	
Minimum allowed voltage 0.0	v	
Analog input 4 voltage	0.0 V	
Maximum allowed voltage 255.99609375	V	
Read Values		Load Values

The setting highlighted above is going to be changed (in this case, the minimum allowed voltage of AU2) from 0 to 5v. To do this, first click inside of the appropriate text box, and delete the contents.

Minimum allowed voltage	1	v
Analog input 2 voltage	0.12890625	v
Maximum allowed voltage	255.99609375	v

Then, enter the desired figures into the boxes like so:

Minimum allowed voltage	5.0	v
Analog input 2 voltage	0.12890625	v
Maximum allowed voltage	255.99609375	v

Finally select the Load Values button found in the bottom right of the window to finalize the values.

### **Voltage Cutback**

The DVT will allow control over the voltage cutbacks for the controller. This can be accessed through the "Voltage Cutback" found here:

Drive 1 Profile	
Drive 2 Profile	Gains
Voltage Cutback	Battery Limits
Torque Control	Steering

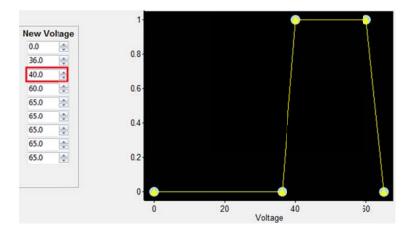

In the table below, it is shown that the voltage for the connected controller is between 36v and 60v. Inside this range, the torque applied by the motor will be as rated. Above or below these limits however; the torque will decrease in proportion to the actual measured voltage.

						Cutback Factor	Voltage Cut	back Factor Table	
						1-		•	
Cutback Gain	New Cutbac	k Gain	Voltage	New V	oltage			}	}
0.0	0.0		0.0	0.0		0.8-			
0.0	0.0	0	36.0	36.0		0.0			
0.9998779296875	0.999877929	58 0	40.0	40.0					
0.9998779296875	0.999877929	566	60.0	60.0	1	0.6-			
0.0	0.0		65.0	65.0					
0.0	0.0		65.0	65.0		0.4-			
0.0	0.0		65.0	65.0	1	0.4			
0.0	0.0		65.0	65.0					
0.0	0.0		65.0	65.0	-	0.2-			
Change Table									
						0- 🔴			•
						Ó	20	40 Voltage	60

age	New Vo	Itage
0.0	0.0	*
36.0	36.0	*
40.0	40.0	*
60.0	60.0	-
65.0	65.0	*
65.0	65.0	-
65.0	65.0	*
65.0	65.0	-
65.0	65.0	-

These limits are customisable however. Each value has two arrows shown here:

Each click of one of these arrows will increase/decrease the value in the corresponding box by a value of 1.

Alternatively, new values can be entered into the boxes manually through the keyboard. The same customisation can be applied to the level of torque that is cut back in the same way. This is seen under the "New cutback" gain.

### **Power Maps**

The DVT can be used to plot the entire torque/speed relationship of a motor through the use of the "Power Maps" button found here:

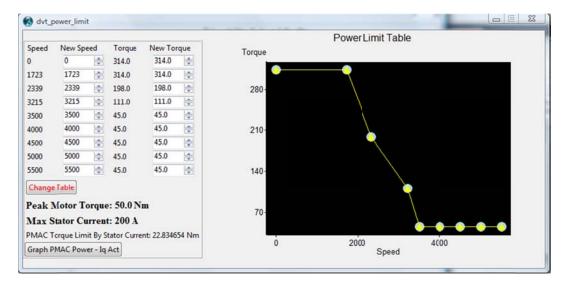

_	Get Controll	ler Information
	Get Fault	Information
Go	Operational	Go Preoperational
PM	IAC Encoder	1

Selecting this button will create a dropdown from the button that looks like this:

Go Operational	Go Preoperational
PMAC Encoder	]
Control Mode 🔹	Power Maps 👻
Baseline Profile	PowerMap1 0x4611
	PowerMap2 0x4615
Drive 1 Profile	PowerMap3 0x4616

Selecting a map will open a table and graph like this:

From this table/graph, the speed and torque settings can both be changed through the same means used in the *Voltage Cutback* section of this manual.

The main function of the power limit table is to protect the motor it is connected to. If the user tries to apply a torque beyond the motors' capabilities, the battery will apply more current to compensate; this can cause serious damage to the motor and other components through overloading. By setting a peak torque and appropriate torques for the speed being used, this can prevent these problems.

### **Battery Settings**

Both the maximum and minimum voltages that can be applied to the controller are

accessible in the DVT. These settings can be changed using the "**Battery Limits**" button, which can be found here:

Baseline Profile	Local Limits	
Drive 1 Profile		
Drive 2 Profile	Gains	
Voltage Cutback	Battery Limits	
Torque Control	Steering	

Selecting the button will bring up a menu on its' right side containing the voltage settings for the controller. To change the under voltage limit (the minimum voltage that can be set without the line contactor opening) from 21.0V to 30V, the process is as follows:

First, clear the text box of the current limit.

Under voltage limit V

And now enter the desired under voltage limit (in this case, 30v)

Under voltage limit	30.0	V

To confirm the change, select the **Load Values** button in the bottom right of the window.

		Trac App Battery
Under voltage limit	30.0	v
Under voltage start cutback	32.0	v
Nominal battery voltage	48.0	v
Over voltage start cutback	60.0	v
Over voltage limit	65.0	v
Read Values		Load Values

### **Control Modes**

The Sevcon motor controller can be configured to motor torque, or speed control mode. DVT can be used to switch between the two modes, by using the "

Control Mode

• " button found:

Go Operational	Go Preoperational
PMAC Encoder	
ontrol Mode	<ul> <li>Power Maps</li> </ul>
Baseline Profile	Local Limits
Drive 1 Profile	

Once this button is selected, a small dropdown menu will come from the button:

Go Operational	Go Preoperational
PMAC Encoder	
Control Mode	Power Maps
Set Torque Mode	Local Limits
Set Speed Mode	
Drive 2 Profile	Gains

When switching the control mode, DVT will first be automatically put into pre-op.

S Command Complete	X
Speed mode set	- you are in preop.
	ОК

The DVT will then confirm whether or not to set the defaults of the set mode. It is recommended to only apply these settings if the default torque or speed mode configuration is needed configuration.

Set Defaults?		×
Would you lik	ke defaults set for s	peed mode?
	Yes	No

## **Controlling Gains**

DVT allows adjustment of various motor control loop configuration, proportional and integral gains. These functions allow tuning of the motor control gains to smoothly

accelerate/decelerate and maintain the requested speed. The "Gains button gives access to these settings and can be found:

Baseline Profile	Local Limits	
Drive 1 Profile		
Drive 2 Profile	Gains	
Voltage Cutback	Battery Limits	

Selecting this button will open up the gains window.

	Speed and Curre	nt Gains	
Proportional gain	0.00390625	-	
Integral gain	0.0625	-	
Low Speed proportional gain	0.0	7	
Low speed integral gain	0.0		
rrent control proportional gain (Kp)	5.11/18/5	7	
Current control integral gain	0.019989013671875	-	
ead Values			Load Value

- The proportional and integral gains are related to the speed control gain.
- The low speed proportional and integral gains are also related to the speed control.
- The current control proportional and integral gains belong to the current control scheme.

In order to get a smooth response from the controller perform slight changes on these values until obtain the right desired response. For more information about tuning techniques please contact Sevcon.

## **Controlling the Torque**

While the baseline profile gives access to the percentage at which torque is applied during a drive/braking. The actual values for the torque can be accessed through the

Torque Control button. It can be found here:

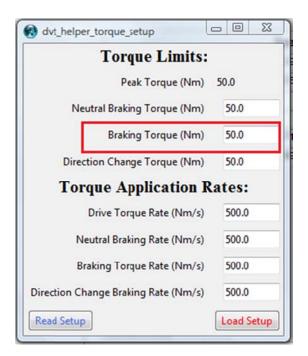

Drive 1 Profile	
Drive 2 Profile	Gains
Voltage Cutback	Battery Limits
Torque Control	Steering

Selecting the button will open a separate window that looks like this:

& dvt_helper_torque_setup	
Torque Limits:	
Peak Torque (Nm)	50.0
Neutral Braking Torque (Nm)	50.0
Braking Torque (Nm)	50.0
Direction Change Torque (Nm)	50.0
Torque Application R	lates:
Drive Torque Rate (Nm/s)	500.0
Neutral Braking Rate (Nm/s)	500.0
Braking Torque Rate (Nm/s)	500.0
Direction Change Braking Rate (Nm/s)	500.0
Read Setup	Load Setup

The peak torque showed on this trace is the actual torque configured (See local limits window) in Nm and its dependent on the motor manufacturer. The values showed below peak torque are all related to the peak torque and the percentages set in the baseline profile. The torque limits are in Nm and rates are Nm/s.

The braking torque (highlighted above) will be changed from 3.5Nm to 20Nm as an example of how to change a setting. To do this, first click inside of the appropriate text box, and delete the contents.

Neutral Braking Torque (Nm)	50.0
Braking Torque (Nm)	

Then, enter the new value into the box:

Neutral Braking Torque (Nm)	50.0	
Braking Torque (Nm)	20	

And finally select the Load Setup button to finalize the values.

Once the values have been changed, there will also be changes to some values in the baseline profile as they are directly related.

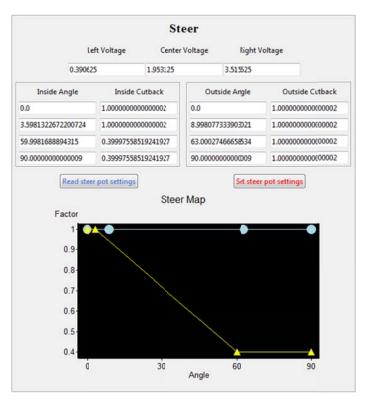

## **Steering**

Twin motor systems, which use the drive motors for turning, require some means of determining the angle of the steering wheel. Complete control of this is given in the "

Steering "button.

Drive 2 Profile	Gains	
Voltage Cutback	Battery Limits	
Torque Control	Steering	

Clicking the button will open a menu to the right of the helper:

From this menu, voltages corresponding to fully left (-90 degrees), straight ahead (0 degrees) and fully right (90 degrees) are accessible. The corresponding values are used by the Gen 4 to calculate the steering angle based on the analogue voltages from the steering potentiometer.

The steering map defines the relationship between the inner and the outer wheel speeds and the steering angle. Each map (inside table and outside table) has 4 definable points; this can be seen on the graph.

The steer map can be defined by 4 points relating the steering angle between 0 and 90 degrees and the torque/speed demand (p.u) between -1 and 1. Where a demand of -1 is shown at 90 degrees, this means the inner wheel demand will be equal and opposite of the outer wheel.

In speed mode, the outer wheel speed target and maximum torque is scaled according to the outer wheel map, while the inner wheel speed target and maximum torque is scaled to the outer wheel demands according to the inner wheel map.

In torque mode, both inner and outer wheel maximum speeds are scaled according the outer wheel map. The outer wheel target torque comes from the throttle. The inner wheel target torque is scaled to the outer wheel actual torque according the inner wheel map. By clicking on **Set steer pot settings** once the data is placed on the spaces and in preoperational, the data should be saved, recycle the power, go to operational and the steering should be ready to use.

### **Driver Pipeline**

The "**Driver Pipeline**" button is a useful window found in the helper that can be used to easily access some useful debugging objects found inside the controller. The button can be found here:

Selecting this button will open up the driver pipeline window to the left of the helper:

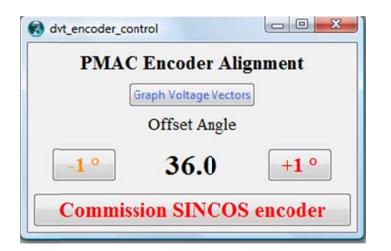

Driver Pipeline			
Currently active highest priority fault	20547.0		
Driveability Profile Status	0x0001		
Traction Drive State	OFF		
Throttle Input Voltage 9.21	09375	v	
Throttle 2 Input Voltage 0.0		V	
Throttle Value	0.0		
Economy Value	0.0		
Torque demand value (U.T_d)	0.0	Nm	
Torque actual value (DWork.Td)	0.0	Nm	
Motor Temperature/Torque Cutback (DWork.Ti_cutback_factor)	0.0		
Cutback Voltage factor (Y.Y_k)	0.0		
Maximum power limit torque (Y.T_power_limit)	0.0	Nm	
Read Values			Load Values

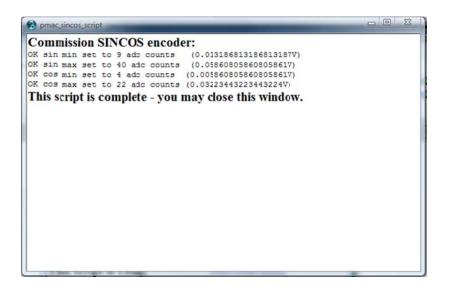

## **PMAC Encoder**

The DVT can be used to manually align the PMAC encoder signals with the mechanical position of the rotor. With this, the controller will know angle of the flux to induce torque into the machine. A misalignment of the encoder will cause reduction of torque per amps available. The allowable range to configure the offset angle is between 128 and -128 degrees. The offset angle can be changed in steps of 1.

our controll	er Information
Get Fault I	Information
Go Operational	Go Preoperationa
PMAC Encoder	L L L L L L L L L L L L L L L L L L L

### **PMAC Max Speed Voltage**

While connected to a PMAC motor, the DVT will perform a check on the allowed BEMF (Back-voltage) the attached motor. The results of these checks can be viewed through the "PMAC Max Speed Voltage" button found here:

Voltage Cutback	Battery Limits
12T Cutback	Testbox
Driver Pipeline	Steering
MAC Max Speed Voltage	Local IO Monitor

Selecting this button will open up a menu containing the voltage data:

Max Speed Check Limit (BEMF V	oltage)
Max Speed Check Limit (BEMF Voltage)	79.2
Max Speed Should Be No Higher Than:	94.54
Overspeed Limit Protection:	32767.0
Drive Profile Forward Limits:	
Baseline:	1000.0
Dr1:	4100.0
Dr2:	4100.0
Drive Profile Reverse Limits:	
Baseline:	1000.0
Dr1:	4100.0
Dr2:	4100.0

From this menu, the user can view all of the data regarding the motor's BEMF voltage limits in a more convenient manner then searching through the tree (see: chapter 3)

### **Local IO Monitor**

DVT can be used to monitor all of the inputs currently affecting the motor controller

using the "Local IO Mor	," button found here:
I2T Cutback	Testbox
Driver Pipeline	Steering
PMAC Max Speed Voltage	Local IO Monitor

Selecting this button will open a menu on the right side of the helper:

Local Digital Inputs: Forward Switch Inactive Reverse Switch Inactive	
Reverse Switch Inactive	
Local Analog Inputs:	
hrottle Input Voltage 10.28515625	

As shown here, the controller has a forward/reverse switch and a throttle. If the state of these inputs is changed, their value on DVT will change alongside them like so:

	oller Inputs		
Local Digital Inputs:			
Forward Switch	Inactive		
Reverse Switch	Active		
ocal Analog Inputs:			
hrottle Input Voltage	7.9375		

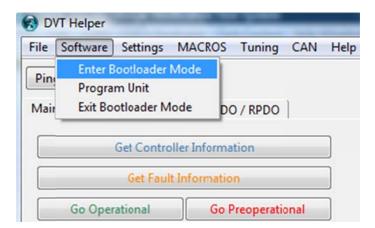

#### 

The firmware of the controller uses a DLD file extension and is an integral part of making the Sevcon motor controller function correctly. DLD is the firmware that configures the controller to different motor types (PMAC, AC induction etc.). Sevcon controllers will come with a DLD already installed that will suit your motor, installing a different DLD however; is fairly simple.

First open the tab found near the top of the helper window labeled "Software" found here:

File	Software	Settings	MACROS	Tuning	CAN	Help
Ping	Node					
Main	Tree	Input / Ou	tput TPDC	O / RPDO	]	
		Get Contro	oller Informa	tion		
		Get Fau	lt Informatio	n		
	Go Ope	rational	Go F	reoperati	onal	

Selecting this tap will open a small drop down menu, to begin the process of installing a new DLD; first select the "Enter Bootloader Mode" option found here:

While in bootloader mode; the motor controller will be unresponsive to commands, and will display errors or timeout when changes are attempted to anything aside from software.

Selecting the "Software" tab again, this time select the "Program Unit" option found here:

File	Software Settings MA	CROS	Tuning	CAN	Help	
Pine	Enter Bootloader Moo	e				
Pini	Program Unit					
Mair	Exit Bootloader Mode	DO	/ RPDO	1		
		20	/ 10 00			
			, na 00		_	
	Get Controller	_				
	Get Controller Get Fault Inf	nformat	tion			

Selecting this will open windows explorer, select the desired DLD and open it.

The DVT will then being automatically installing the DLD into the controller, its progress can be viewed in the "Information" window.

```
nformation

found 1 memory ranges in //sevcon2/users4/Anthony.Scott/My Documents/New_slip.dld (modified 09/17/12 - 11:30:42):

...dsp-zeffer

programming dsp-zeffer on node 1 .....OK

block checksum 0x011f5583
```

With that, the DLD is successfully installed. Open the software tab again, and select "Exit Bootloader Mode" to complete the process.

### **Uploading and Downloading Settings (DCF)**

Configuration files have the DCF extension and are the files in which the settings and parameters of the controller are stored. DCFs can both be uploaded and downloaded from the controller through the "Settings" tab near the top of the Helper window.

File Software	Settings MACROS Tuning CAN
Ping Node	Save DCF
Pingivode	Save Partial DCF
Main Tree	Send DCF To Unit
	Compare DCFs
	Create EDS
	Find Range Error
Go Oper	Copy Baseline to Dr. Profile 1
[	Copy Baseline to Dr. Profile 2
PMAC E	ncouer

Selecting "Save DCF" will save the current configuration inside the controller to wherever the user wants. Changing DCF however is done through the "Send DCF to Unit" option found here:

File Software	Settings MACROS Tuning CAN	Help
Ping Node	Save DCF Save Partial DCF	
Main Tree	Send DCF To Unit	
	Compare DCFs	_
	Create EDS	
	Find Range Error	
Go Oper		
PMAC E	Copy Baseline to Dr. Profile 2	
Control Mode	Power Maps	
Baseline	Profile Local Limits	]

Selecting this option will open windows explorer:

Selecting a DCF will result in an upload bar opening over the DVT main screen showing the progress of the DCF installation.

🖄 Dow	nloading
X	Sending to the controller.

When the bar has filled, a message should appear at the bottom of the input window confirming the successful installation.

dvt(102) % //sevcon2/users\$/Anthony.Scott/My Documents/notbroken.dcf downloaded to device OK Already logged in at a higher level logged in... and in preop. Already logged in at a higher level

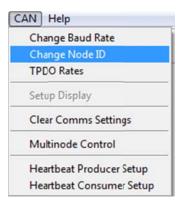

//sevcon2/users\$/Anthony.Scott/My Documents/notbroken.dcf downloaded to device OK

### **Changing Node ID Number**

DVT can be used to change the node ID of a unit through the helper's CAN tab found here:

File	Software	Settings	MACROS	Tuning	CAN	He
Ping	Node					No
Main	Tree	Input / Ou	tput   TPDC	O / RPDO	ĺ	
		Get Contr	oller Inform	ation		
		Get Fau	ult Informati	on		
	Go Op	erational	Go	Preopera	tional	

Selecting this tab will open a dropdown menu. To change the node ID of a unit, select the "Change node Id" option

This will open a small window inside the helper in which the user can set the new CAN ID, in this scenario the ID will be set to 2.

Sat	New Node ID
Sel	New Node ID
2	

Select "Set Node ID" and DVT will prompt the user to recycle power on the system. After the power has been recycled, the new node ID will be set. This can be checked by looking at the numbers in the CAN traffic as shown below:

BEFORE (Node ID 1)

	T
0x07	գ
0x07	d1
0x07	d1

Chapter 3: Tree

A

The easiest way to navigate the settings and features of the Sevcon motor controller is the Tree menu found here:

Main	Tree Input / Output   TPDO / RPDO				
	Get Controll	er Information			
	Get Fault I	Information			
	Go Operational	Go Preoperational			
<b></b>	PMAC Encoder				

Selecting this tab will open the Tree menu:

From this menu, there are a couple of different methods that can be used in searching for specific variables or objects. For example, the most intensive of these is the "

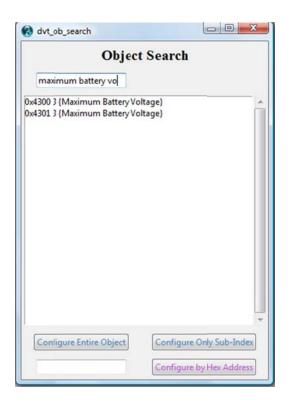

Search

" button. Doing so will open a window that looks like so:

dvt_ob_search	
Object	Search
0x1005 0 {Synchronisation (SYN 0x1006 0 {Interval between SYN 0x1008 0 {Product name} 0x1009 0 {Hardware version} 0x1004 0 {Software version} 0x1014 0 {Emergency (EMCY) to 0x1016 0 {Consumer heartbeat 0x1016 1 {Consumer heartbeat 0x1016 2 {Consumer heartbeat 0x1016 3 {Consumer heartbeat 0x1016 5 {Consumer heartbeat 0x1016 5 {Consumer heartbeat 0x1016 6 {Consumer heartbeat 0x1016 6 {Consumer heartbeat 0x1016 7 {Consumer heartbeat 0x1016 7 {Consumer heartbeat 0x1016 7 {Consumer heartbeat 0x1016 7 {Consumer heartbeat 0x1017 0 {Producer heartbeat 0x1018 1 {Vendor ID} 0x1018 2 {Product code} 0x1018 3 {CANopen (Object Dio 0x1018 4 {Serial number}	C messages (Communication elegram COB-ID) time} time for 1st node} time for 2nd node} time for 3rd node} time for 3rd node} time for 5th node} time for 5th node} time for 7th node} me}
Configure Entire Object	Configure Only Sub-Index
	Configure by Hex Address

In this scenario, a search is going to be performed for the "Maximum Battery Voltage". To do this, enter the term into the search bar found at the top of the object search window.

There is then a choice between viewing the single sub-index that has been searched for or the entire object the sub-index is contained in. Selecting either will present the selected object/index here:

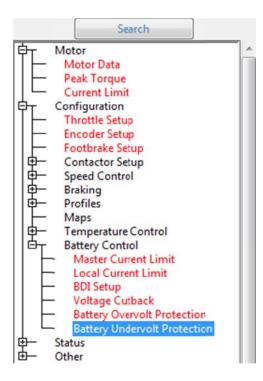

(Single index)

#### (Full Object)

	Operat	ional Mo	nitor - Sevco	n Copy	
Minimum Battery Voltage	0.46484375	v			
Maximum Battery Voltage	4.98828125	v			
Minimum Capacitor Voltage	0.09375	V			
Maximum Capacitor Voltage	4.96875	v			
Minimum Motor Current 1	0.0	A(RMS)			
Maximum Motor Current 1	224.0	A(RMS)			
Minimum Motor Current 2	32767.0	A(RMS)			
Maximum Motor Current 2	-32768.0	A(RMS)			
Minimum Motor Speed	-635.0	RPM			
Maximum Motor Speed	4171.0	RPM			
Minimum Device Temperature	17.0	DegC			
Maximum Device Temperature	61.0	DegC			

Alternatively, the objects can be browsed through a series of drop-down menus found below the "search" button. For example, to find the under voltage cutback in the tree: first open drop down menus by selecting the "+" icon until finding the relevant heading. In this case the battery undervolt protection.

Selecting this will create a window to the right of the tree. The settings can then be read/changed using the same method as any other tab in the helper.

### Chapter 4: Input/output Configuration

# I/O Configuration

Sevcon motor controllers can be configured to work with a variety of input/output components of both analogue and digital nature. These features can be accessed through the "Input/Output", tab found here:

Main	Tree	Input / Outp	ut TPDO / RPDO
		Get Controlle	er Information
		Get Fault I	nformation
	Go Op	erational	Go Preoperational

Selecting this tab will give access to the Input/output configuration menu:

Mo	otor Control		
Node Controls:	Motor drive left informa	•	
Di	gital Inputs		
# of Inputs:	3	÷	
Digital In. 1:	Forward Switch	•	Pin.18
Digital In. 2:	Reverse Switch	•	Pin.30
Digital In. 3:	Not Mapped	•	Pin.19
Digital In. 4:	Not Mapped	•	Pin.31
Digital In. 5:	Not Mapped	•	Pin.20
Digital In. 6:	Not Mapped	•	Pin.09
Digital In. 7:	Not Mapped	•	Pin.32

## **Motor Control**

By default, the node control will be set to "Motor drive left information". This is the default setting when a single traction motor system is being configured, if you would like information on the other settings however, contact Sevcon.

## **Digital Inputs**

Both digital and analogue inputs are governed by the pins in the control unit harness. The settings for the digital inputs can be found here:

Me	otor Control	
Node Controls:	Motor drive left informa	-
Di	gital Inputs	
# of Inputs:	3	
Digital In. 1:	Forward Switch	Pin.18
Digital In. 2:	Reverse Switch	Pin.30
Digital In. 3:	Not Mapped	Pin.19
Digital In. 4:	Not Mapped	Pin.31
Digital In. 5:	Not Mapped	Pin.20
Digital In. 6:	Not Mapped	Pin.09
Digital In. 7:	Not Mapped	Pin.32
Digital In. 8:	Not Mapped	Pin.21
Digital In. 9:	Not Mapped	-
Digital In. 10:	Not Mapped	-
Digital In. 11:	Not Mapped	-
Digital In. 12:	Not Mapped	-
Digital In. 13:	Not Mapped	-

To begin with, the "'# of inputs" setting has to be set exactly. For example, if the number is set to four, but there are five inputs configured; the helper will stop reading after input number four.

The # of inputs can be changed by the small arrows (highlighted in blue), which will raise the number by one in each direction. Alternatively, the number can be entered manually in the white box beside the arrows. Setting the number to anything above thirteen will result in the # of inputs back to its default.

To change a digital input; selecting the arrow of the input that will be changed will open a drop-down menu like so:

Digital In. 3:	Not Mapped	-	Pin.19
Digital In. 4:	Not Mapped		Pin.31
Digital In. 5:	Key switch Horn switch		Pin.20
	Drive enable switch		Pin.09
Digital In 7	E 16.51	_	Pin 32

Select the new input (in this case, an inch reverse switch), and select the **Load Values** button to finalize the changes.

Digital In. 2:	Reverse Switch	-	Pin.30
Digital In. 3:	Drive enable switch	•	Pin.19

To ensure that changes have taken place, select the **Read Values** button.

Chapter 5: TPDO/RPDO

## **TPDOs/RPDOs**

The Sevcon motor controller can be configured to transmit and/or receive PDOs information packets, known as TPDOs and RPDOs respectively. The configured message structures can be viewed and edited through the **TPDO/RPDO** tab, found here:

Main	Tree	Input / Outp	ut TPDO / RPDO
		Get Controll	er Information
		Get Fault I	nformation
	Go Op	erational	Go Preoperational

Selecting the tab will open the PDO configuration window.

Sync Period			
Setup TPDO 1	Setup RPDO 1		
Setup TPDO 2	Setup RPDO 2		
Setup TPDO 3	Setup RPDO 3		
Setup TPDO 4	Setup RPDO 4		
Setup TPDO 5	Setup RPDO 5		
Setup PMAC Default TPDOs			
Setup I/M Default TPDOs			

Up to five RPDOs and TPDOs can be configured at any one time, per Sevcon controller. The creation/editing window looks like this:

RPDO 2	2
Cob-ID for this PDO:	0x80000000
Syncs Per Transmit:	1
Bits Used:	0
Bits Left:	64
Remove Item	Add Item
Move Item Up	Move Item Down
Read PDO	Write PDO
Add dummy b	oolean
Add dummy	8bit
Add dummy	16bit
Add dummy	32bit

Each PDO must have a unique Cob-ID which denotes the priority of the associated PDO, the lower the number; the higher the priority of the PDO.

The PDOs have a data size limit of 64 bits (8 bytes), meaning that the RPDO can only contain a certain number of objects.

## **TPDOs**

Add Item

Begin by selecting the Add Item button; this will open a window in front of the helper:

2	🚯 dvt_pdo_search
	Add Object
	Search
	0x1000 0 {Device type} 32 0x1001 0 {Error register} 8 0x1005 0 {Synchronisation (SYNC) message COB-ID} 32 0x1006 0 {Interval between SYNC messages (Communicat 0x1008 0 {Product name} ??? 0x1009 0 {Hardware version} ??? 0x1004 0 {Software version} ??? 0x1010 1 {Save all parameters} 32 0x1011 1 {Load all parameters} 32 0x1014 0 {Emergency (EMCY) telegram COB-ID} 32 0x1016 1 {Consumer heartbeat time for 1st node} 32 0x1016 3 {Consumer heartbeat time for 3rd node} 32 0x1016 3 {Consumer heartbeat time for 3rd node} 32
	0x1016 4 {Consumer heartbeat time for 4th node} 32 0x1016 5 {Consumer heartbeat time for 5th node} 32 0x1016 6 {Consumer heartbeat time for 6th node} 32 0x1016 7 {Consumer heartbeat time for 7th node} 32 0x1017 0 {Producer heartbeat time} 16 0x1018 1 {Vendor ID} 32 0x1018 2 {Product code} 32
	Map Object

Selecting the search button or pressing any key will cause the window to fill with objects.

TPDO 1 in this scenario is going to be given the "Heatsink temp" object. To do this, enter the terms into the search bar found at the top of the add object window, and then select the search button.

Selecting the map objects button will add the object to the TPDO.

🚯 dvt_pdo_search				
Add	Object			
heats	Search			
0x4602 9 {Heatsink Temperat 0x5100 4 {Heatsink Temperat				
Map Object				

Finally, select the Write PDO button, close and re-open the helper to ensure the changes have happened.

TPD	01
Cob-ID for this PDO:	0x00000268
Syncs Per Transmit:	1
Bits: 16   Adr: 0x4600,5   Target Id Bits: 16   Adr: 0x4600,6   Target Iq Bits: 16   Adr: 0x4600,8   Iq <u>Bits: 8   Adr: 0x5100,4   Heatsink Te</u>	<u>mperature</u>
Bits Used:	56
Bits Left:	8
Remove Item	Add Item

Note: When adding objects into a PDO, ensure that there are adequate bits left for the desired objects.

### **RPDOs**

Begin by selecting the Add Item button; this will open a window in front of the helper:

Selecting the search button or pressing any key will cause the window to fill with objects:

😵 dvt_pdo_search	
Add Object	
Search	
0x1000 0 {Device type}32	.
0x1001 0 {Error register} 8	
0x1005 0 {Synchronisation (SYNC) message COB-ID} 32	
0x1006 0 {Interval between SYNC messages (Communical	
0x1008 0 {Product name} ???	
0x1009 0 {Hardware version} ???	
0x100A 0 {Software version} ???	
0x1010 1 {Save all parameters} 32	
0x1011 1 {Load all parameters} 32	
0x1014 0 {Emergency (EMCY) telegram COB-ID} 32	
0x10161 {Consumer heartbeat time for1st node} 32	
0x1016 2 {Consumer heartbeat time for 2nd node} 32	
0x1016 3 (Consumer heartbeat time for 3rd node) 32	
0x1016 4 {Consumer heartbeat time for 4th node} 32 0x1016 5 {Consumer heartbeat time for 5th node} 32	
0x1016 6 {Consumer heartbeat time for 5th hode} 32

0x1017 0 {Producer heartbeat time}16	
0x1018 1 {Vendor ID} 32	
0x1018 2 {Product code} 32	-
Map Object	

RPDO2 in this scenario is going to be given the "Battery Voltage" and "Vehicle Speed". To do this, the procedure is the same as seen in the TPDO section of this guide:

🚯 dvt_pdo_search	
Add Object	
battery volt	Search
0x2C00 0 {Nominal battery voltage}16 0x4300 2 {Minimum Battery Voltage}16 0x4300 3 {Maximum Battery Voltage}16 0x4301 2 {Minimum Battery Voltage}16 0x4301 3 {Maximum Battery Voltage}16	^
0x4602 17 {Battery Voltage} 16 0x4641 12 {Nominal battery voltage} 16 0x5100 1 {Battery Voltage} 16	
0x5100 6 {Battery Voltage (8-bit)} 8	
	-
Map Object	

Selecting the map objects button will add the object to the RPDO.
